

Save energy,
save money
and reduce
your carbon
footprint

Heat recovery systems for
oil lubricated compressors

Recovering the excess heat
from your compressor saves money
and reduces your carbon footprint

Why heat recovery?

It is a thermodynamic fact that around 94 % of the energy needed to run a compressor gets converted to heat. Without heat recovery, this heat is directly blown into the atmosphere.

The heat generated during compression is paid for as part of the process, then it creates additional costs as this heat needs to be removed by cooling fans. At the same time, most companies consume a lot of energy and money to generate hot process water, space heating or preheat water for steam generation.

Given that compressed air systems account for 10% of all electricity used in industry, and energy is the largest single lifecycle cost of a compressor, it makes sense to recover this heat, save energy and reduce costs.

It's critically important that we focus on energy now and in the future:

- **Energy prices** will almost certainly continue to increase
- Compressed air is considered expensive, but alternative electric tools are not necessarily cheaper options, if you do consider that you can re-use the **heat to save energy somewhere** else in your facilities
- Concerns for the **environment and sustainable development** are growing
- Countries and industries face **stringent targets** to reduce carbon dioxide emissions

Turn this waste heat to your advantage: recovering it will allow you to save huge amounts of energy, cut CO₂ emissions and improve operating costs.

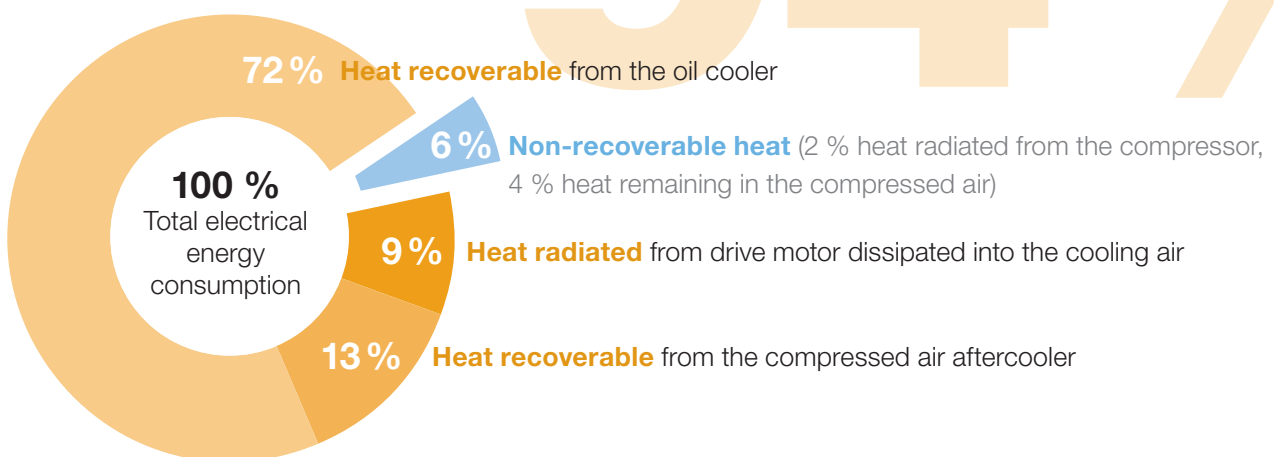

Give your compressed air system an efficiency upgrade

With a heat recovery system from CompAir, the heat generated by the compressor can be re-used, providing the following **benefits**:

- Significant savings in energy costs
- Extremely short payback time – low investment costs payback time typically less than 1 year
- Lower CO₂ emissions
- Turnkey solutions
- Easy installation and operation
- Small ecological footprint
- High reliability
- No impact on the compressed air supply

Heat recovery potential

Under ideal circumstances **up to 94%** of the waste heat can be recovered for re-use.

CompAir heat recovery solutions

The basic principle lies in the transfer of the heat to a medium and then transporting it to where the heat can be utilised.

Factory- or retro-fitted

Instead of simply removing the heat from the airend, it can be used to generate free hot process water or supplement hot water heating systems by utilising a high-efficiency, factory-fitted (or retro-fitted) oil-to-water heat exchanger.

1. Factory fitted

2. As a retrofit kit with all necessary piping and fittings for subsequent installation on site

Applications for heat recovery

Oil to water heat exchanger

By re-directing the hot cooling oil to a high efficiency **oil to water heat exchanger**, the heat can be transferred **to water, raising the temperature** to a required level for a multitude of applications – heating, process, production or washing:

Heating

Heat recovery systems are perfect for augmenting your facility's heating system. By utilising the heat energy from your compressor(s) that would otherwise go to waste, you can keep your premises warm, reduce your heating bill and cut back on your company's carbon emissions.

Hot water

Heat recovery systems can provide up to 72 % of the energy required to heat your hot water system. By utilising the heat energy that would otherwise go to waste, you can have running hot water and cut back on your company's carbon emissions.

Industrial process

Heat recovery systems can also be used to pre-heat the water supplying your process application requirements, for example, steam generation. Anywhere hot water is required, supplying pre-heated water makes the process more cost efficient.

Defined air outlet

An enclosed, air cooled compressor with **defined air outlet** can transfer the total amount of heat of the cooling air for **ambient air heating**:

Ambient air heating

The compressor's heated cooling air can be utilised to increase the ambient temperature of rooms instead of being dissipated into the atmosphere. By ducting the air to somewhere where it would be more useful, you can increase the ambient temperatures of those rooms and save on their heating costs.

Heat recovery systems for a sustainable future

With over 200 years of engineering excellence, the CompAir brand offers an extensive range of highly reliable, energy efficient compressors and accessories to suit all applications.

An extensive network of dedicated CompAir sales companies and premium partners across all continents provide global expertise with a truly local service, ensuring our advanced technology is backed up with the right support.

CompAir has consistently been at the forefront of compressed air systems development, culminating in some of the most energy efficient and low environmental impact compressors on the market today, helping customers achieve or surpass their sustainability targets.

CompAir compressed air product range

Advanced Compressor Technology Lubricated

- Rotary Screw
 - > Fixed and Regulated Speed
- Portable

Oil-Free

- Water Injected Screw
 - > Fixed and Regulated Speed
- Two Stage Screw
 - > Fixed and Regulated Speed
- Rotary Scroll
- ULTIMA®

Complete Air Treatment Range

- Filter
- Refrigerant and Desiccant Dryer
- Condensate Management
- Heat of Compression Dryer
- Nitrogen Generator

Modern Control Systems

- CompAir DELCOS Controllers
- SmartAir Master Sequencer
- iConn – Smart Compressor Service

Value Added Services

- Professional Air Audit
- Performance Reporting
- Leak Detection

Leading Customer Support

- Custom Engineered Solutions
- Local Service Centres
- Genuine CompAir Parts and Lubricants
